"Neuropathogenicity of Newcastle Disease Virus Strains in Day-Old Chicks"

Budapest, Acta Veterinaria Academia Scientiarum Hungaricae, Vol 16, No 2, 27 Jun 1966, pp 187-192.

Abstract: [English article] The author attempted to develop a reliable method for the differentiation of the lentogenic and mesogenic strains of Newcastle disease virus. The results of neuropathogenicity tests carried out by intracerebral inoculation of the virus vaccine strains into day-old chicks were reported. The findings, presented and discussed in some detail, indicated that a twelve-day observation period is required for the precise evaluation of the results. 5 references, including 1 Polish, 1 German, 1 Hungarian, and 2 Western. TITLE: Development of Lorinc-Goracz type of acute renal hypertension in cats

SOURCE: Kiserletes Orvostudomany, v. 17, no. 1, 1965, 40-42

TOPIC TAGS: experiment animal, surgery, blood pressure, urology, animal physiology

ABSTRACT:

The hypertension operation described by Lorinc and Goracz on rats can also be used on cats. The essence of the technique is the covering of both kidneys with a slightly extended rubber capsule. The normal blood pressure of 32 cats was 143 mm Hg. The blood pressure of 5 animals remained unchanged following a sham operation. Of the remaining 27 animals, the blood pressure rose to above 200 mm Hg in 19, three days after the operation, 3 showed no significant change and 5 died. The maximal blood pressure obtained was 240 mm Hg. From the fourth postoperative day on, the animals succumbed rapidly. For this reason, the method can only be used in acute experiments. TITLE: Chromatometric determination of metal anthranilates according to the 1:56 equivalent weight ratio

SOURCE: Magyar kemiai folyoirat, v. 71, no. 6, 1965, 244-247

TOPIC TAGS: chromatographic analysis, solution property, metal compound, stoichiometry

ABSTRACT: A method was described for the chromatometric determination of bivalent metals in low concentrations. The metals suitable for this technique must be capable of forming stoichiometric anthranilates of low water-solubility. The analytical technique involves oxidation of the anthranilic acid by hexavalent chromium in sulfuric acid medium and titration with sodium bichromate solution. The method is sensitive; suitable for concentrations in the 50 μ g. to 5 mg. range, and rapid; one determination can be completed in about one hour. Accuracy is $\pm 0.2 - \pm 10\%$, depending on concentration. Orig. art. has: 6 tables.

TITLE: Chromatometric determination of anthranilic acid by total wet oxidation according to an equivalent weight ratio of 1 : 28

SOURCE: Acta chimica academiae scientiarum Hungaricae, v. 44, no. 3, 1965, 267-276

TOPIC TAGS: organometallic compound, chromate

ABSTRACT: As seen by the experimental results, anthranilic acid undergoes oxidation with sodium dichromate, in a medium of concentrated sulfuric acid at 115° within 40 minutes, in a stoichiometric reaction with the formation of water, carbon dioxide and ammonia. The mixture used for the moist combustion can also be used as a standard solution. When the solution is diluted at the end of the reaction, the excess chromium(VI) in it can be titrated with iron(II) in the presence of ferroin as indicator. When an 0.5 per cent correction is applied for the spontaneous decomposition of chromium(VI) solution not consumed in the oxidation, the titration values for anthranilic acid and for metal anthranilates agree within ± 0.2 per cent. One ml of 0.1 N sodium dichromate corresponds to 0.4898 mg of anthranilic acid or M/650*mg of divalent metals. *M = molecular wt. The authors thank Professor, Doctor B. Lengyel for his participation in the experimental work. Orig. art. has: 1 figure and 6 tables. [Based on authors' Eng. abst.] [JPRS: 33,540]

Budapest, A Magyar Tudományos Akadémia Biológiai Tudományok Osztályának Közleményei, Vol IX, No 3-4, 1966, pages 283-299.

Abstract: In the present article, a study involving a small Hungarian group living at the Kustanay area of the Kazah Republic in the USSR is reported. Geological and ethnographic data are followed by a detailed description of the results of an anthropological study. In summary, it is concluded that, according to the available anthropological and auxiliary data, the Hungarian group in the Turgay region of the Kustanay area represents remnants of a larger ethnic unit which lived in the border area of Eurasia about 1500 years ago. All 27 references are Eastern European.

The changes in the fundus in juvenile hypertension are different from those in adults because the vessels are still flexible. The neurovegetative changes are more important: increased volume of the vessels and oedema of the papilla. The author considers the question whether these children are predisposed to develop essential hypertension. The neurovegetative disequilibrium may be compared to the same findings in the climacterium.

"Phenylthiazine Derivatives and Other Drugs Determined in Dimethylformamide Medium with Standard Aqueous Sodium Hydroxide."

Budapest, Acta Pharmaceutica Hungarica, Vol 33, No 2, Apr 63, pp 22-26.

Abstract: [Authors' Hungarian summary] The authors found that the method of Matronier and Rochelmeyer is well suited for the quick determination of the hydrochlorides of phenylthiazine derivatives which are known to be quite unstable, without prior separation. The method is useful also for the test of other drugs of different structure. The method did not appear to be always reliable when employed in the testing of pharmaceutical preparations. One western reference.

Orig Pub : Cukeripar, 1957, 10, No 9-10, 149-155

Abstract : Fundamental conditions for a successful purification of a diffused liquor, i.e. processes of preclarification, main clarification and primary saturation, are presented. Also discussed are: the significance of progressive introduction of limestone during preclarification and of the recycling of different amounts of the saturated liquor into the diffused one. The effect of the inverted sugar on clarification and saturation processes and on the isoelectric point readings is also shown.

Title : Use of Spark Counters for Registration of Fast Neutrons

Orig Pub : Studii si cercetati fiz. Acad. RFR, 1958, 9, No 4, 497-504

Abstract : An experimental investigation was made of the possibility of using spark counters for the registration of fast neutrons. Several spark counters with one or several anodes were constructed, filled with air, oxygen, or nitrogen at atmospheric pressure. When the counters are filled with air or hydrogen, the neutrons are registered by their recoil nuclei (or the products of the nuclear reaction). Counters filled with nitrogen are sensitive to thermal neutrons thanks to the reaction $N^{14}(n, p)C^{14}$.

Title : Time of Flight Neutron Spectrometer

Orig Pub : Studii si cercetari. fiz., 1959, 10, No 1, 89-98

Abstract : Description of the construction and of the principal parameters of a 64--channel time pulse analyzer, intended for operation with a neutron spectrometer. The analyzer makes it possible to make qualitative measurements in a neutron time of flight of 2 -- 10 160 microseconds (without a delay line) and in the interval 32 -- 80 microseconds (with an additional delay line). Block diagrams of the neutron spectrometer and the principal diagrams of the time pulse analyzer circuit are given.

TITLE: Some data on nonspecific connections between the thalamus and the cortex

SOURCE: AN GruzSSR. Institutu fiziologii. Trudy. v. 14, 1965. Sovremennyye problemy deyatel'nosti i stroeniya tsentral'noy nervnoy sistemy (Present problems of the activity and structure of the central nervous system), 173-180

TOPIC TAGS: CNS, thalamus, cortex, nerve fiber, neural degeneration, optic thalamus, visual cortex, optic nerve

ABSTRACT: The distribution of terminal degeneration of nerve fibers at various intervals after surgically-inflicted injury of nonspecific thalamic nuclei (in the centrum medianum) was studied in cats using method proposed by Nauta and G, ax. Degenerated fibers were found not only in the areas where they were observed by Nauta and Whitlock, but also in the cerebral cortex (gyrus suprasylvius medius) and throughout the caudate nucleus, where they were discovered 29 days after injury. No brain damage along the electrode trace was seen in 29 day-specimens. No

Card 1/2

I. 22224-66

ACC NR: AT5024236

degenerated nerve fibers were seen in either the corpus callosum or the pyramidal pathways. Degenerated fibers and preterminals found in other parts of the brain are therefore attributed to injury to the centrum medianum of the optic thalamus. Because in specimens taken at shorter periods than 29 days the picture of fiber degeneration is obscured by injuries along the electrode path, it is not possible to say whether the centrum medianum has direct connections with other cortical gyri (besides the gyrus suprasylvius medius). TITLE: Spinal-reticular pathways

SOURCE: AN GruzSSR. Institut fiziologii. Trudy, v. 14, 1965. Sovremennyye problemy deyatel'nosti i stroyeniya tsentral'noy nervnoy sistemy (Present problems of the activity and structure of the central nervous system), 227-233

TOPIC TAGS: spinal reticular path, reticular formation, dorsolateral spinal column, posterior spinal column, preterminal degeneration, preterminal degeneration method

ABSTRACT: The existence of spinal-reticular pathways was investigated in cats by the degeneration method. The posterior and dorsolateral columns of the spinal cord were cut between the 3rd and 4th cervical vertebrae in nembutal-narcotized cats. The animals were killed 10 to 11 days after resection, and formalin-fixed preparations were made using the method suggested by Nauta and Cygax. In the medulla oblongata, preterminal degeneration is clearly evident in the lateral reticular nucleus and the nucleus of the raphe, less clearly in the reticular

Card 1/2

L 22209-66

ACC NR: AT5024240

parvocellular nucleus and reticular ventral nucleus. Very little degeneration was seen in the reticular gigantocellular nucleus. Gradually decreasing in the oral direction, preterminal degeneration occurs as far as the reticular formation of the mesencephalon. When the dorsolateral column was resected simultaneously with the posterior column, degeneration is seen in the pyramidal tracts and the nucleus reticularis tegmenti pontis, in addition to the areas mentioned above. The results obtained agree well with those of Walberg and Brodal. [DP]
